AI Powered Trading

User Guide

Every screen explained, with the steps to get things done

Version: October 2026

For: anyone using the app to plan, test and practise NIFTY 50 and BANKNIFTY options trades.

About the pictures: all screenshots use the fake demo account "Priya Nair" and fake test data. The numbers you see on your own screen will differ.

> **Careful:** This is an educational research tool. It places **no real orders**, and nothing it shows is financial advice. Prices come from loaded datasets (fake or historical), not from the live market.

Contents

1. What the app does, and a 5-minute quick start

2. Key ideas in plain words (glossary and experience levels)

3. The screens: Login, Layout, Dashboard, Strategy Desk, Backtest, Paper Trading, Profit & Loss, Knowledge Base, Settings & Models

4. Step-by-step recipes for common jobs

5. How the numbers are worked out

6. Troubleshooting and FAQ

7. Limits and safety

Appendix: sources used for the explanations

1. What the app does

You describe a trade in your own words, for example the index, the expiry, how much you can lose on one trade and what you hope to make. A team of AI agents then **researches** the idea (from a knowledge base and recent market news), **designs** a rule-based strategy, **verifies** it, **backtests** it on historical option candles and **reviews its risk**. You get a trade plan with reasons, which you can **paper-trade** with virtual money. If you ever trade for real, you place the orders yourself in your own broker app.

What it is not

- Not a broker: no order ever leaves the app.
- Not live: paper trading replays a loaded dataset with a clock, it does not stream live prices.
- Not advice: the plans are research output built on past or fake data.

Quick start (about 5 minutes)

1. **Log in** (or create an account). Pick your experience level: Beginner, Advanced or Expert.
2. Open **Strategy Desk**. Type what you want, for example: "BANKNIFTY monthly expiry, use EMA with RSI, capital 2 lakh, max loss 5000, target 12000".
3. Choose the **Underlying** and, if you like, the **Expiry** from the dropdown. Check the **Model** (pick a real model if the default says mock).
4. Press **Generate strategy** and wait one to two minutes while the five steps on the right turn green.
5. Read the **AI recommendation** in the middle: the contract, lots, stop, target, the reasons and when to trade.
6. Press **Paper trade CE** or **Paper trade PE** to practise the plan with virtual money, or **Open full backtest results** to study how it did on past data.
7. Use **Paper Trading** to move the replayed market forward and watch your position, and **Profit & Loss** to review how you did on a day or over a range.

> **Tip:** New to options? Read section 2 first. It takes five minutes and explains every word the screens use.

2. Key ideas in plain words

Word	What it means here
Underlying	The index the option is based on. This app supports **NIFTY** (Nifty 50) and **BANKNIFTY** (Nifty Bank).
Option, CE and PE	A contract that gives the right, not the duty, to trade the underlying at a fixed price. **CE** (call) gains when the index rises, **PE** (put) gains when it falls. This app only **buys** options, so the most you can lose on a trade is the premium you paid.
Strike	The fixed price of the contract, for example 25900 or 60500.
Premium	The price of one option. It has two parts: intrinsic value (what it would be worth if exercised now) and time value (the chance it becomes valuable before expiry).
Lot and lot size	Options trade in fixed bundles. **1 lot = lot size units** (NIFTY 65, BANKNIFTY 30 at the time of writing). Cost of one lot = premium x lot size. The exchange changes lot sizes now and then, so check before real trading.
Expiry: weekly and monthly	The day the contract ends. Index options settle in cash. A month's last expiry is the **monthly** one, the others are **weekly**. An exchange holiday can move an expiry to an earlier day, so the app shows the exchange's own list.
ATM, ITM, OTM	**ATM**: the strike is about equal to the index (at the money). **ITM**: a call with a strike below the index, or a put above it (in the money, dearer). **OTM**: the opposite (out of the money, cheaper, needs a bigger move).
Stop loss	An automatic exit if the premium falls by a set percentage from your entry. It limits the loss on a trade.
Target	An automatic exit if the premium rises by a set percentage. It books the profit.
Square-off	A forced exit at a set time (15:15 here) so an intraday trade is not carried overnight.
Candle and timeframe	One bar of price data. A 5-minute candle summarises five minutes (open, high, low, close). The app reads prices candle by candle.
Backtest	Running a strategy's rules over **past** data to see what it would have done. Useful, but past results do not promise future ones.
Paper trading	Practising with virtual money. In this app the market is a dataset replayed by a clock.
Equity, cash	**Cash**: virtual money not tied up in positions. **Equity**: cash plus the current value of open positions.
Realised and unrealised P&L	**Realised**: profit or loss of trades already closed. **Unrealised**: paper profit or loss of positions still open.
Win rate	Share of trades that made money.
Profit factor	Total of winning trades divided by the total of losing trades. Above 1 means winners outweighed losers.

Word	What it means here
Drawdown	How far your running profit fell from its highest point. A measure of how painful the bad patches were.
Expectancy	Average profit or loss per trade.
Sharpe	Return compared with how bumpy it was. Higher is smoother. It needs many trading days to mean much.

Experience levels

Your level is set at sign-up and can be changed any time in **Settings & Models**. It changes how the agents explain things and which safety guardrails apply. The numbers themselves never depend on the level.

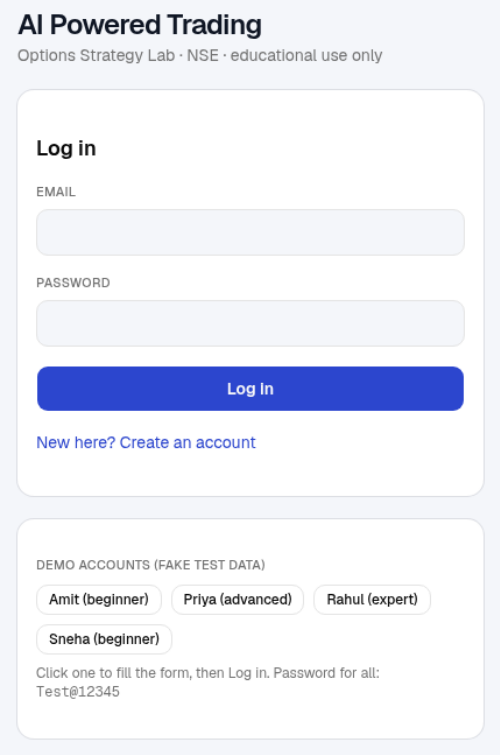

Level	How the agents talk and plan	Guardrails added to your plan
Beginner	Plain words, each term explained, simple strategies with one or two indicators, conservative stops.	A note appears if your max loss is above **2%** of capital. At most **3 trades a day** are allowed.
Advanced	Normal depth. A few indicators together are fine, trade-offs mentioned briefly.	A note appears if your max loss is above **5%** of capital.
Expert	Short and technical, no basics. Talks about sensitivity to parameters and market regimes.	A note appears if your max loss is above **10%** of capital.

3. The screens

Every screen below follows the same pattern: what it is for, what you see, how to do the common tasks, and what to watch out for. The sidebar on the left of the app takes you between screens.

3.1 Login and Create account

Use it to: sign in, or make a new account. You need to be logged in to see anything else. Your strategies, backtests, runs and paper account belong to you; other users cannot see them.

What you see

- **Email** and **Password** boxes and the **Log in** button.
- **New here? Create an account** switches the form to sign-up (see below).
- **Demo accounts (fake test data):** one-click buttons that fill the form for the practice users. All use the password shown. These exist only for local testing.

How to log in

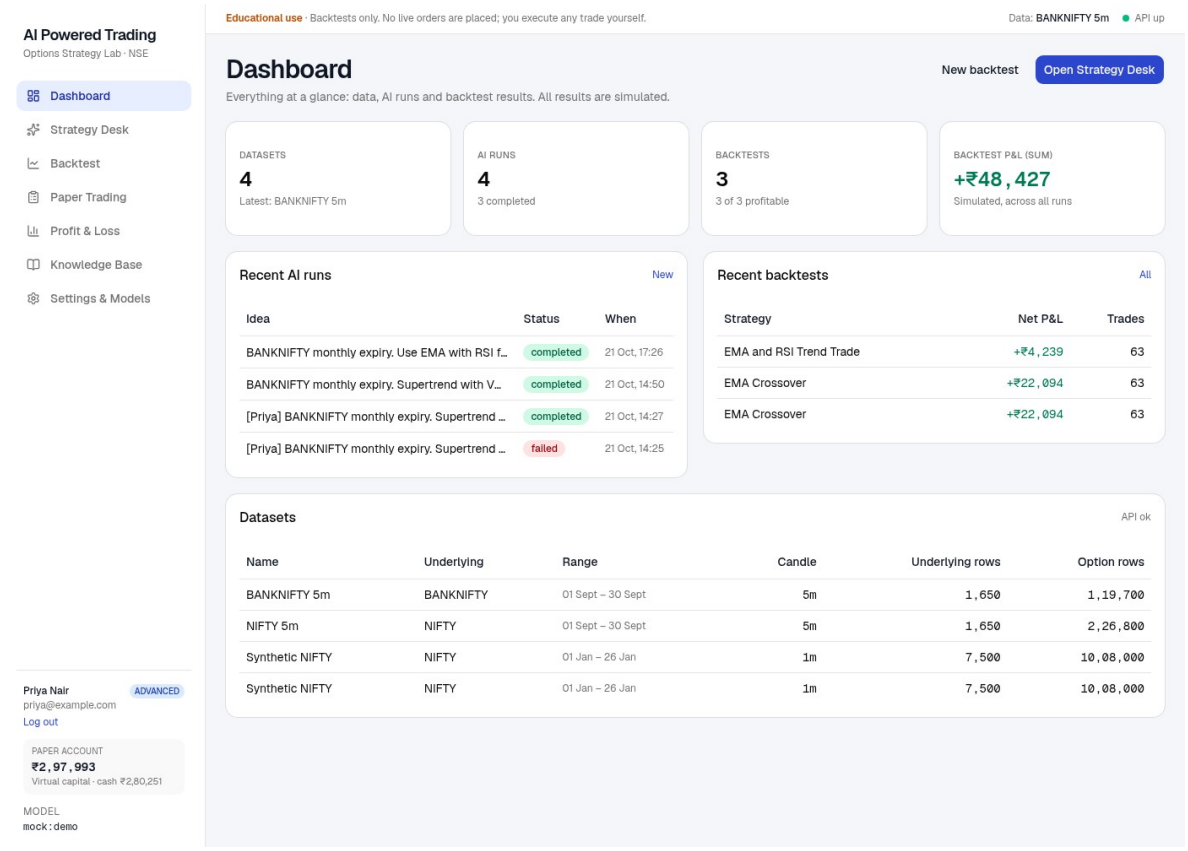

1. Type your email and password, or press a demo account button.
2. Press **Log in**. You land on the Dashboard.
3. Press **Log out** (bottom of the sidebar, or in Settings) when you are done.

How to create an account

1. Press **New here? Create an account**.
2. Enter your **name**, **email** and a **password of at least 8 characters**.
3. Choose your **experience** level: Beginner, Advanced or Expert.
4. Press **Create account**. You are logged in straight away.

> **Note:** A login lasts about a week, then you are sent back to this screen. Eight wrong passwords for one email within ten minutes lock that email for the rest of that window. If sign-up says "Registration is disabled", ask whoever runs the app for an account.

3.2 The layout: sidebar and top bar

The sidebar (left) and top bar (top) appear on every screen after login.

Part	What it does
Sidebar menu	Dashboard, Strategy Desk, Backtest, Paper Trading, Profit & Loss, Knowledge Base, Settings & Models. The current screen is highlighted.
User card	Your name, your level (Beginner, Advanced or Expert) and email, and **Log out**.
Paper account box	Your virtual **equity** (large) and **cash**. Click it to open Paper Trading. It updates when you trade.
Model	The AI model used when you do not choose one yourself. **mock:demo** is an offline stand-in with scripted answers, not a real model.
Top bar notice	A reminder that this is educational and sends no real orders.
Top bar status	**Data:** the newest dataset loaded. **API:** a green dot means the app's server is up, red means it cannot be reached, amber means a part of it is struggling.

3.3 Dashboard

Use it to: see everything at a glance and jump back into earlier work.

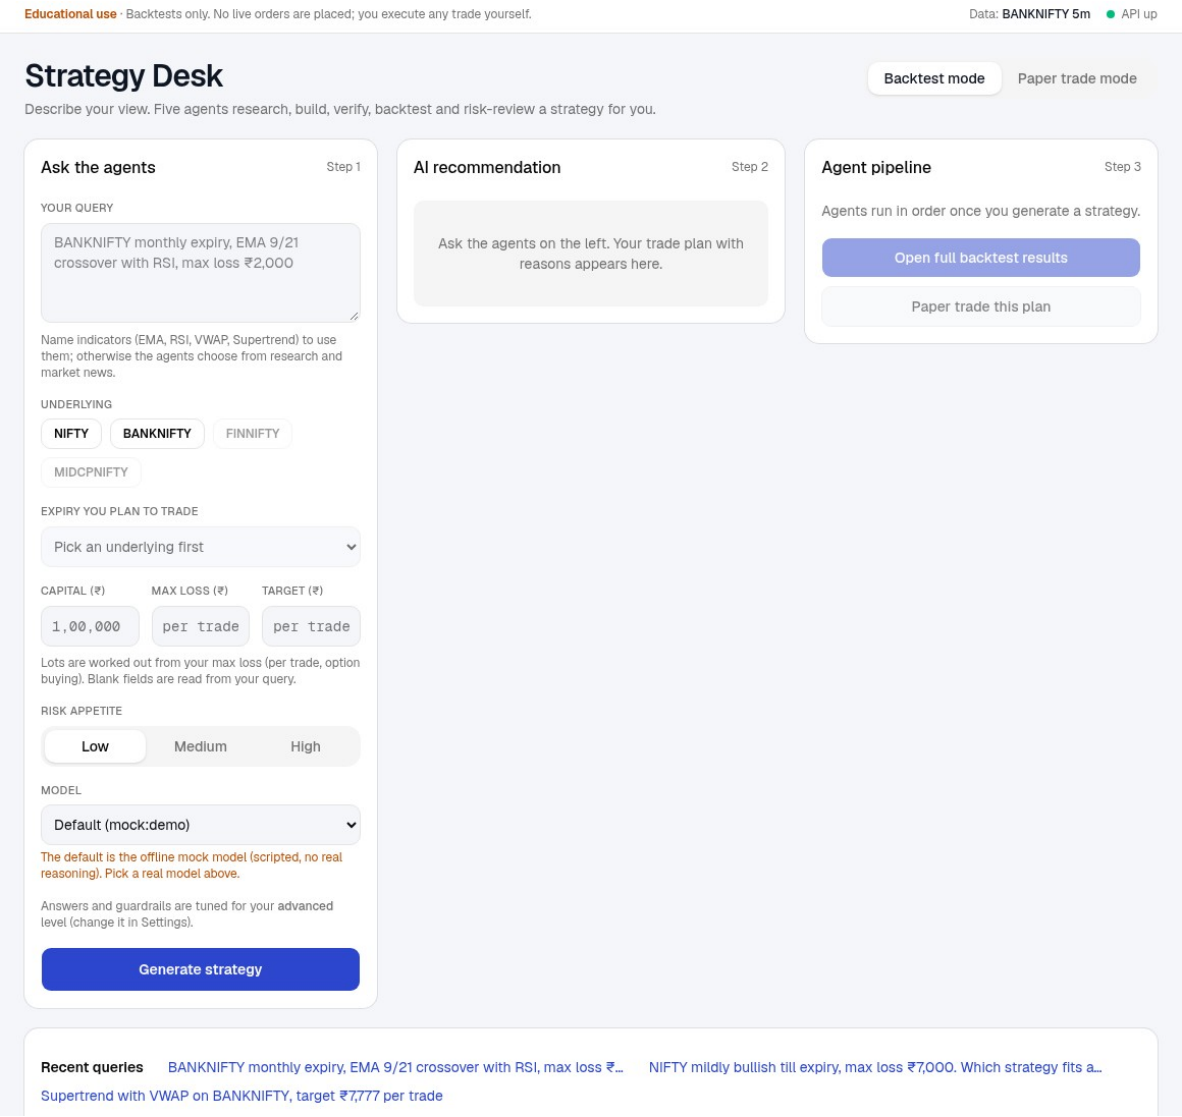

Part	What it shows
Four cards	**Datasets** loaded (and the latest), **AI runs** (and how many completed), **Backtests** (and how many were profitable), **Backtest P&L (sum)** across all your backtests.
Recent AI runs	Your latest Strategy Desk runs with their status (completed, running, failed). **Click the idea** to reopen that run in the Strategy Desk with its plan.
Recent backtests	Latest backtests with net profit and number of trades. **Click a strategy name** to open its full results.
Datasets	The market data you can test on: name, index, date range, candle size and how many rows it holds.
Buttons	**Open Strategy Desk** to start a new plan; **New backtest** to test a built-in strategy directly.

How to

- **Reopen an earlier plan:** click its idea under Recent AI runs.
- **See why a run failed:** open it; the pipeline panel shows which step failed and why.
- **No datasets?** The Backtest and Paper Trading screens need market data. Ask whoever runs the app to load a NIFTY or BANKNIFTY dataset with option candles, or create a small fake one from New backtest.

3.4 Strategy Desk

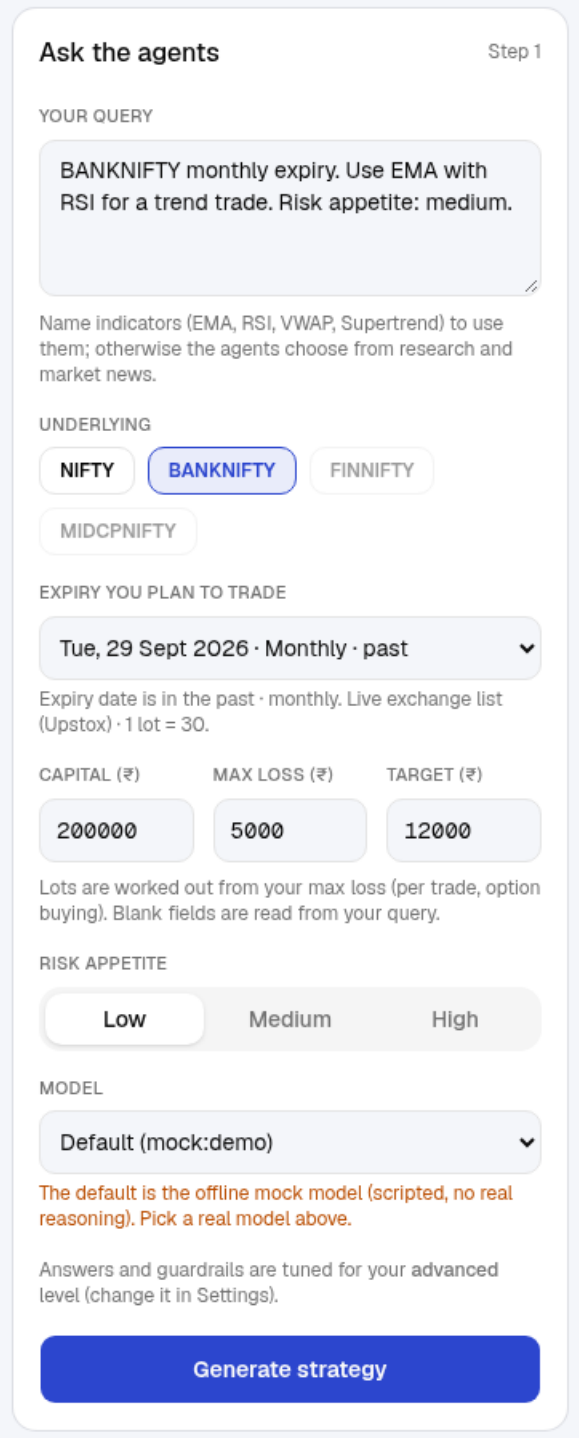

Use it to: get a complete trade plan from a plain-language request. This is the main screen. It has three panels that you read left to right: **Ask the agents** (step 1), **AI recommendation** (step 2) and **Agent pipeline** (step 3).

The Strategy Desk when you first open it: the form on the left, empty panels on the right.

> **Note:** The top-right switch shows **Backtest mode**. **Paper trade mode** is a shortcut to the Paper Trading screen.

Panel 1: Ask the agents

Field	What to enter
Your query	Describe the trade in your own words (English, Hindi or Hinglish).
Underlying	NIFTY or BANKNIFTY. FINNIFTY and MIDCPNIFTY are greyed out: not supported yet.
Expiry	Pick from the live exchange list. It shows weekly or monthly, days left and the lot size. Leave blank and the agents use your query or the nearest expiry.
Capital	Your trading money in rupees.
Max loss	The most you accept losing on **one trade**, in rupees.
Target	The profit you hope for on **one trade**, in rupees.
Risk appetite	Low, Medium or High. Added to your request as a hint.
Model	Which AI to use. Pick a real model when the default says mock.

A line under the form reminds you that answers and guardrails follow your level. **Recent queries** at the bottom of the screen are saved in your browser; click one to reuse it.

How to write a good query

Say this	Why it helps
The index and the expiry	"BANKNIFTY monthly expiry" tells the agents which contract family to design for.

Say this	Why it helps
Your limits as numbers	"capital 2 lakh, max loss 5000, target 12000". The app turns them into lots, stop and target. Say "per trade" so it is clear.
Indicators, if you have a favourite	"Use EMA with RSI", "Supertrend with VWAP". If you name none, the agents choose from the research and market news and explain why.
Direction or style, if any	"mildly bullish", "trend trade", "avoid trading near close".

Weak query	Better query
make profit in banknifty	BANKNIFTY monthly expiry. EMA 9/21 crossover with RSI filter. Capital 2 lakh, max loss 5000 per trade, target 12000.
good strategy	NIFTY weekly expiry, mildly bullish, Supertrend with VWAP, max loss 3000 per trade.

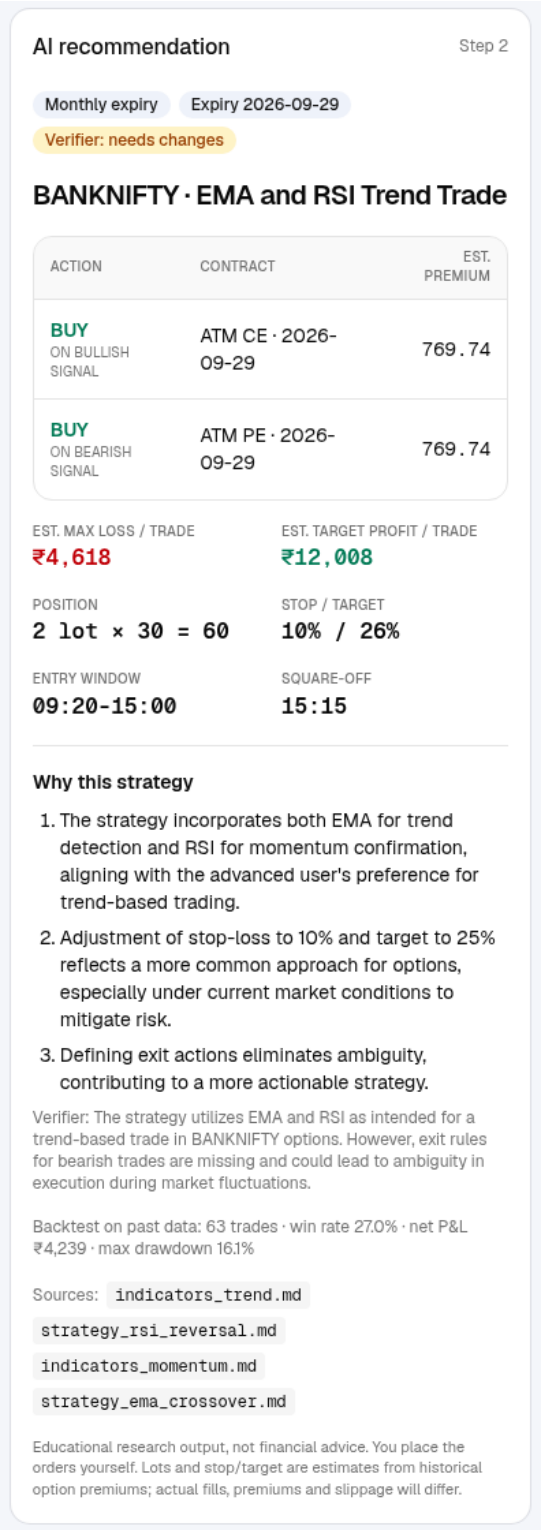

> **Tip:** Blank **Capital**, **Max loss** and **Target** boxes are read from your query. A value you type in a box always wins over the query. The app also fills the boxes with what it understood, so you can see and correct it.

How to generate a plan

1. Write your query and pick the **Underlying** (or mention it in the query).
2. Optionally pick the **Expiry**, and fill **Capital**, **Max loss** and **Target**.
3. Choose **Risk appetite** and the **Model**.
4. Press **Generate strategy**. The button shows "Agents are working...". Do not close the page; it takes one to two minutes.
5. When all five steps on the right show a green tick, read the middle panel.

> **Note:** If the box under the form turns amber with notes, the app could not tell something (for example whether your amounts are per trade or per day). Read the notes and correct the boxes.

Panel 2: AI recommendation

Reading the plan, top to bottom

- **Badges:** weekly or monthly expiry, the expiry date, and the verifier's verdict (approved, needs changes or rejected).
- **Title:** the index and the strategy name.
- **Action table:** BUY, on a bullish signal buy a **CE**, on a bearish signal buy a **PE**. **Contract** shows how the strike is chosen (for example ATM) and the expiry. **Est. premium** is the price estimated from the data.
- **Est. max loss / trade** and **Est. target profit / trade:** what a stop-out or a target hit would roughly cost or earn, in rupees.
- **Position:** lots x lot size = quantity.
- **Stop / target:** percentages of the premium you paid.
- **Entry window and square-off:** the hours the plan may enter, and the forced exit time.
- **Why this strategy:** the reasons for each choice. **When to trade:** when it enters and when it stays out.
- **Backtest line:** how the rules did on past data.
- **Sources:** the knowledge-base notes the research used.

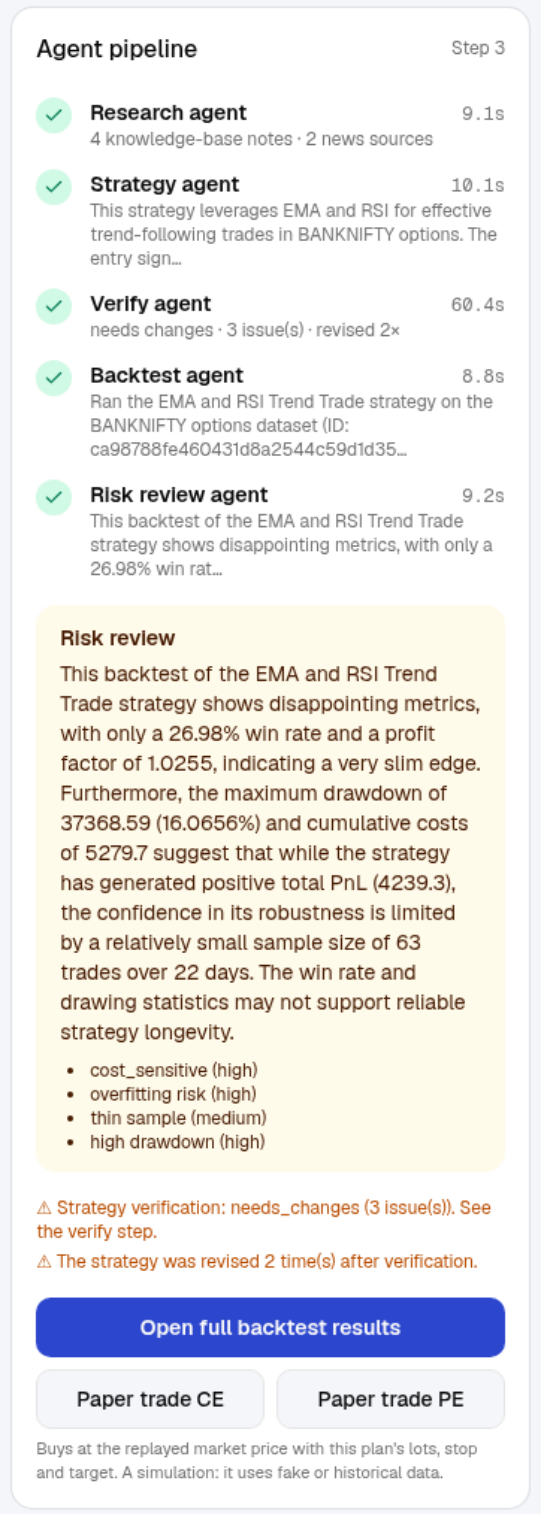

What the verifier's verdict means

Verdict	What to do
Approved	The checker found no serious problem with the rules, risk settings or fit with your request. You can go on to paper trading or study the backtest.

Verdict	What to do
Needs changes	The checker found issues it could not fully fix after up to two revision rounds. Read the pipeline panel's note and the plan's reasons, then either run again with a clearer query or treat the plan with extra caution.
Rejected	The strategy does not do what you asked or cannot work. Rephrase and generate again.

Careful: A profitable backtest is not proof of an edge. Check the **number of trades** and the **drawdown**, not only the profit. Fake or very short data can show wins by luck.

Panel 3: Agent pipeline

The five steps

- **Research:** reads the knowledge base and recent market news.
- **Strategy:** writes the rules and the reasons.
- **Verify:** checks the strategy; if it is not approved it is sent back for up to two revisions.
- **Backtest:** runs the approved rules on past data.
- **Risk review:** points out weaknesses such as few trades, high costs or a large drawdown.

Each step shows its time. A yellow **Risk review** box lists the main risks. Orange warning lines tell you if the plan was revised.

Buttons

- **Open full backtest results:** the complete results screen (section 3.5).
- **Paper trade CE / PE:** opens a paper position that follows the plan. Only the sides the plan actually buys are offered. If the plan says to sell an option, paper trading cannot follow it (it only buys).

How to paper-trade a plan

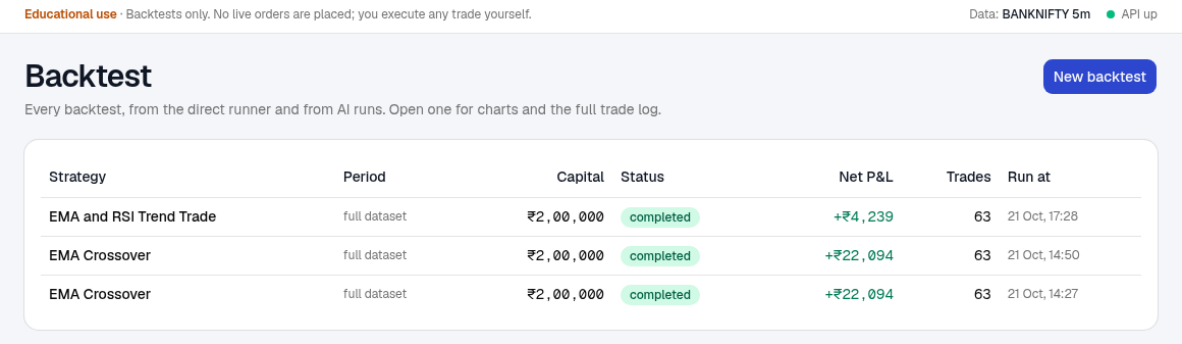

1. Generate a plan and read it.
2. Press **Paper trade CE** (for the bullish side) or **Paper trade PE** (bearish side).
3. You land on **Paper Trading**. The plan's contract is now an open position with the plan's lots, stop, target and square-off time.
4. Move the market forward with the clock buttons and watch what happens.

> **Note:** **Asking general questions** ("what is theta decay?") is supported by the system's back end, but the Strategy Desk box does not have a question mode yet. Anything you type here is treated as a request to build a strategy.

3.5 Backtest: list, New backtest and Results

Use it to: test a built-in strategy yourself, and study how any strategy behaved on past data. AI plans from the Strategy Desk also appear here.

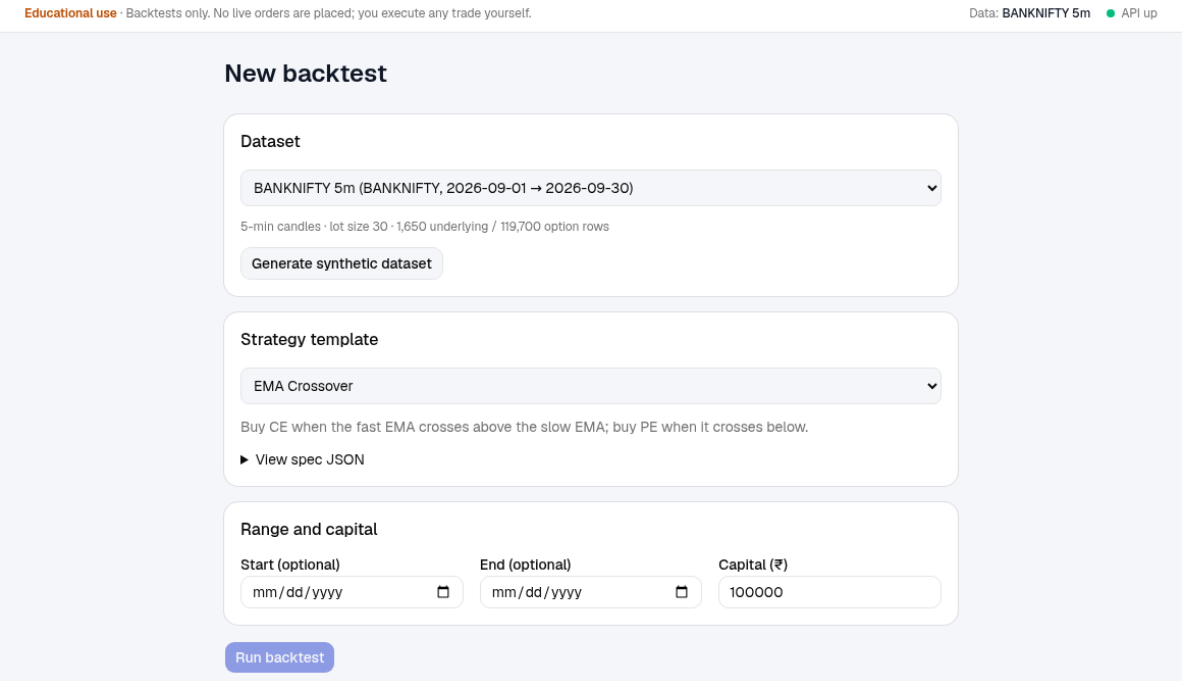

The backtest list

Every backtest you ran, from here and from AI plans.

Columns: **Strategy**, **Period** ("full dataset" or the dates you chose), **Capital**, **Status**, **Net P&L** after brokerage, slippage and taxes, **Trades** and when it was run. Click a strategy name to open its results.

New backtest

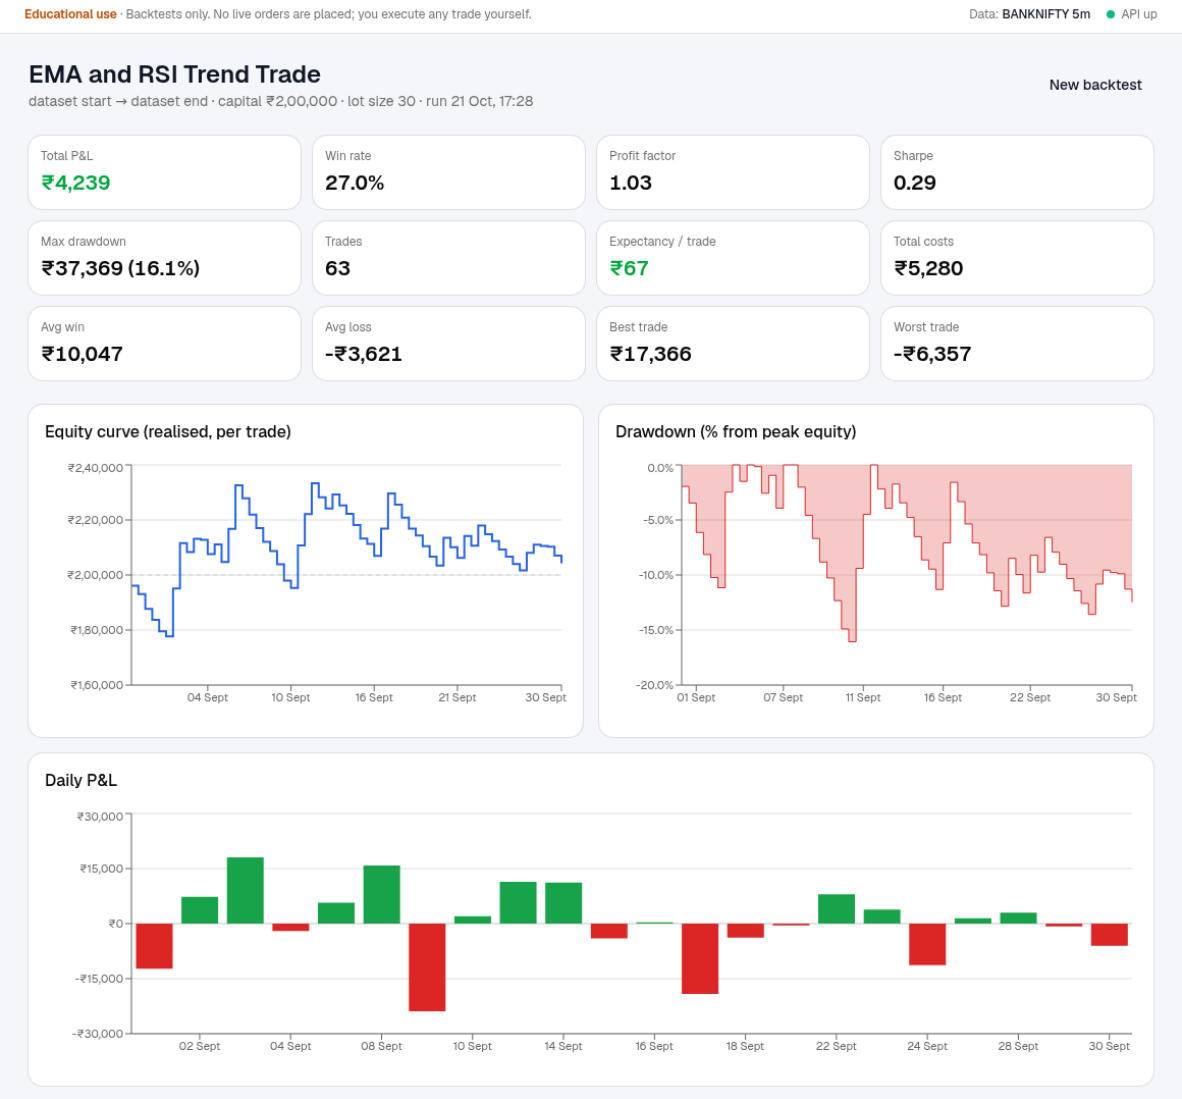

Choose data, a strategy and a period, then run.

1. Press **New backtest** (top right of the list).
2. **Dataset:** choose the market data. The line below it tells you the candle size, lot size and number of rows.
3. **Strategy template:** choose EMA Crossover or RSI Reversal. A sentence explains it; **View spec JSON** shows the exact rules.
4. **Range and capital:** leave **Start** and **End** blank to use the whole dataset, or set dates inside the data. Set your **Capital**.
5. Press **Run backtest**. You go straight to the results.

> **Tip:** No dataset? Press **Generate synthetic dataset** to make a small **fake** NIFTY dataset to practise on. Results on fake data say nothing about real markets.

Results

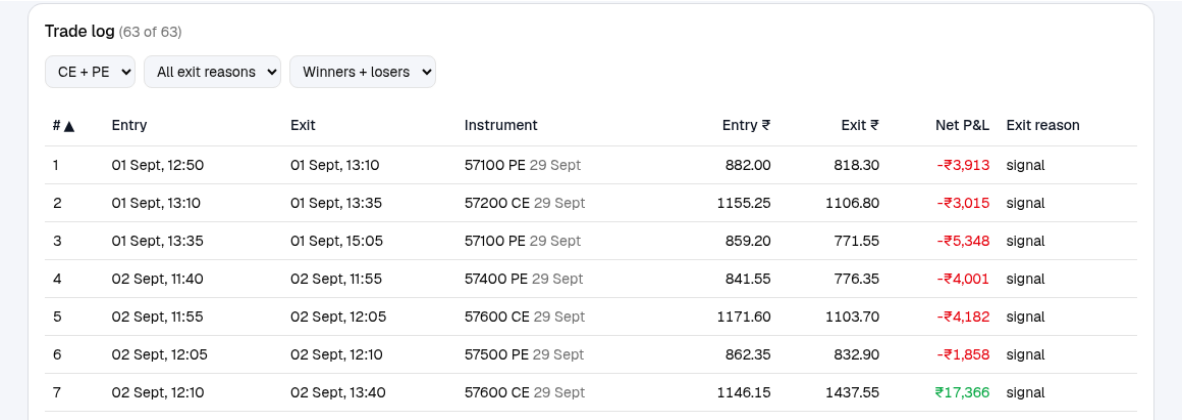

Results: twelve numbers on top, then three charts.

Card	Meaning
Total P&L	Net profit or loss after all costs.
Win rate	Share of trades that made money.
Profit factor	Winning trades' total divided by losing trades' total. Above 1 is better.
Sharpe	Return per unit of bumpiness (needs many days to mean much).
Max drawdown	The biggest fall from a peak, in rupees and as a percentage.
Trades	How many trades the rules took. Very few trades means the result is weak evidence.
Expectancy / trade	Average profit or loss per trade.
Total costs	Brokerage and taxes paid over the whole test.

Card	Meaning
Avg win, Avg loss, Best trade, Worst trade	The size of typical and extreme trades.

- **Equity curve:** your money after each closed trade. It should drift up without huge dips.
- **Drawdown:** how far below the previous peak you were, in percent.
- **Daily P&L:** each day's result as green or red bars.

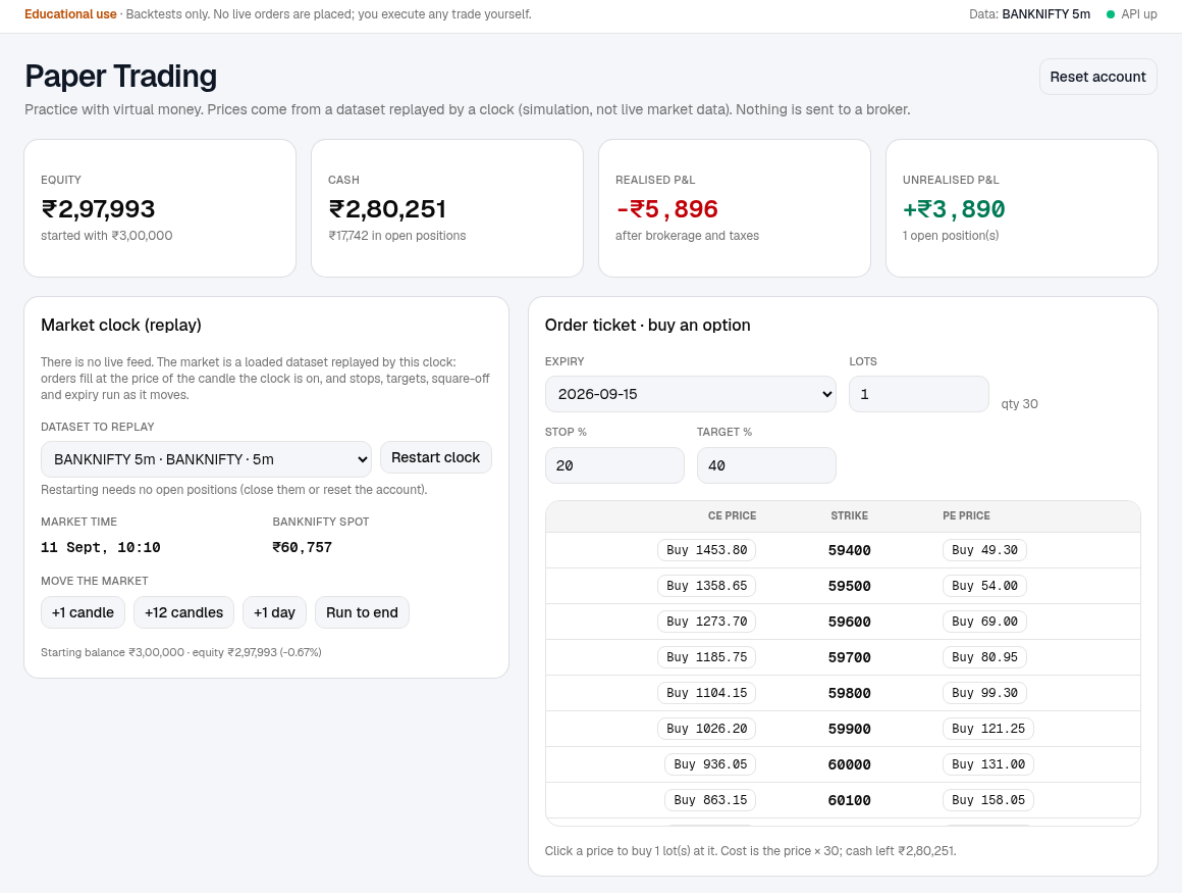

The trade log. Use the three drop-downs to filter and click a column heading to sort.

- **Trade log:** every trade with entry and exit time, instrument (strike, CE or PE, expiry), prices, net profit and the **exit reason** (signal, stop_loss, target, square_off).
- Use the drop-downs to show only CE or PE, only one exit reason, or only winners or losers. Click a heading to sort.
- **Skipped events** (when shown) lists signals the engine could not trade, for example no option price at that time.

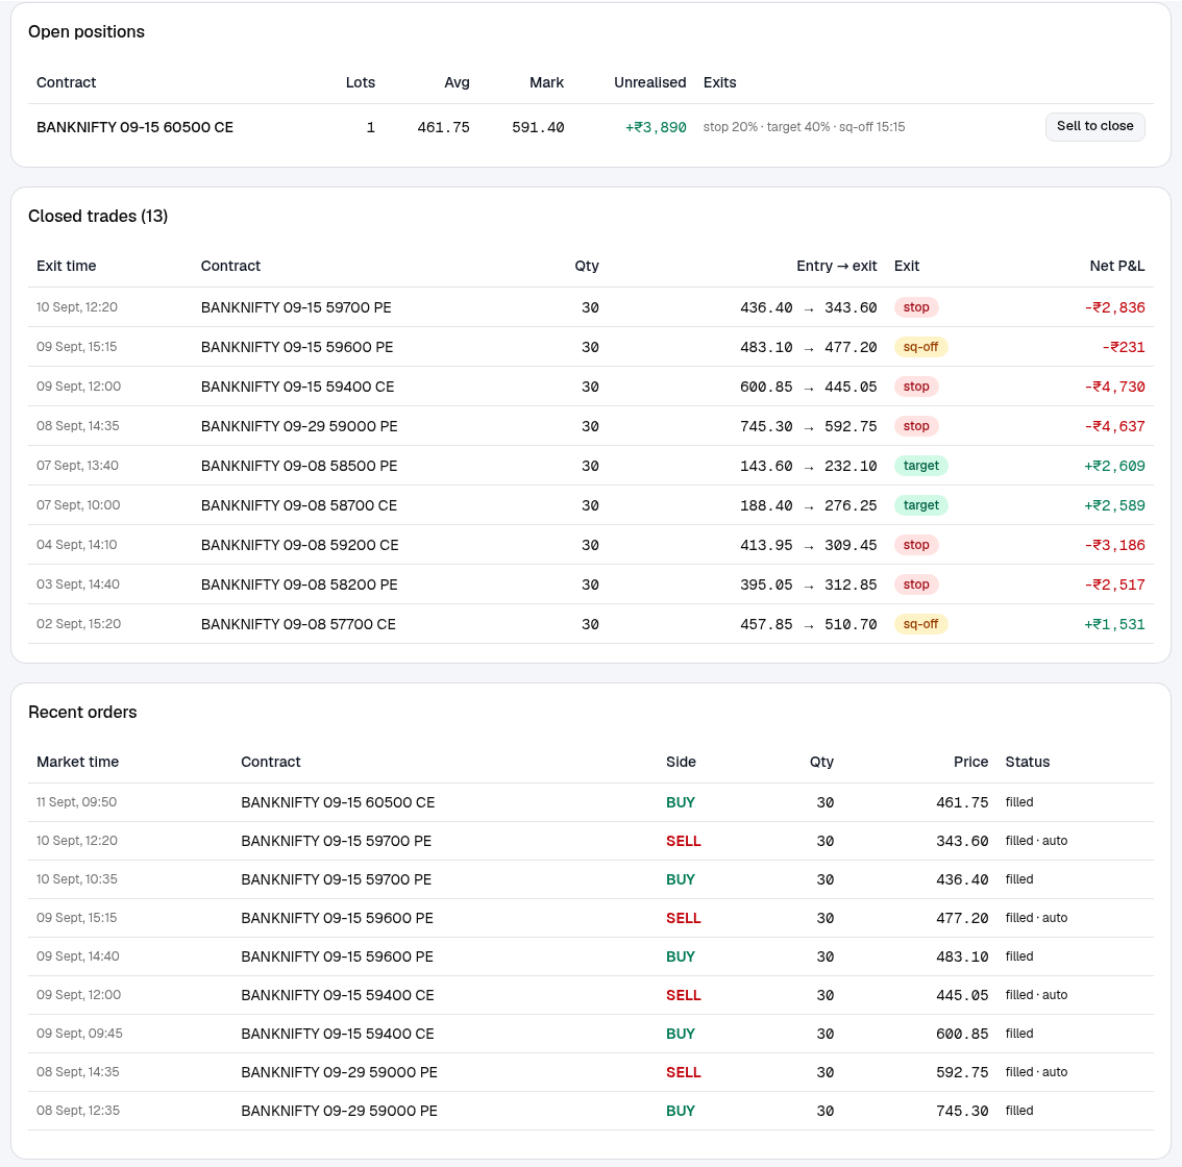

3.6 Paper Trading

Use it to: practise buying and selling options with virtual money. There is no live feed: a **market clock** replays a dataset, and you decide when time moves on.

Top half: your balance, the market clock and the order ticket.

Part	What it does
Four cards	**Equity** (cash plus open positions), **Cash**, **Realised P&L** (closed trades, after costs) and **Unrealised P&L** (open positions).
Market clock	Choose the **dataset to replay** and press **Start clock** (or **Restart clock**). It shows the **market time** and the index **spot**. **+1 candle**, **+12 candles**, **+1 day** and **Run to end** move the market forward.
Order ticket	Pick an **expiry**, set **lots**, **stop %** and **target %**, then click a **Buy** price in the option chain: CE prices on the left, PE prices on the right, the strike in the middle. The at-the-money row is highlighted.
Reset account	Top right. Deletes all positions, orders and trades, and sets the starting balance you type.

Open positions

Contract	Lots	Avg	Mark	Unrealised	Exits	
BANKNIFTY 09-15 60500 CE	1	461.75	591.40	+₹3,890	stop 20% · target 40% · sq-off 15:15	Sell to close

Closed trades (13)

Exit time	Contract	Qty	Entry → exit	Exit	Net P&L
10 Sept, 12:20	BANKNIFTY 09-15 59700 PE	30	436.40 → 343.60	stop	-₹2,836
09 Sept, 15:15	BANKNIFTY 09-15 59600 PE	30	483.10 → 477.20	sq-off	-₹231
09 Sept, 12:00	BANKNIFTY 09-15 59400 CE	30	600.85 → 445.05	stop	-₹4,730
08 Sept, 14:35	BANKNIFTY 09-29 59000 PE	30	745.30 → 592.75	stop	-₹4,637
07 Sept, 13:40	BANKNIFTY 09-08 58500 PE	30	143.60 → 232.10	target	+₹2,609
07 Sept, 10:00	BANKNIFTY 09-08 58700 CE	30	188.40 → 276.25	target	+₹2,589
04 Sept, 14:10	BANKNIFTY 09-08 59200 CE	30	413.95 → 309.45	stop	-₹3,186
03 Sept, 14:40	BANKNIFTY 09-08 58200 PE	30	395.05 → 312.85	stop	-₹2,517
02 Sept, 15:20	BANKNIFTY 09-08 57700 CE	30	457.85 → 510.70	sq-off	+₹1,531

Recent orders

Market time	Contract	Side	Qty	Price	Status
11 Sept, 09:50	BANKNIFTY 09-15 60500 CE	BUY	30	461.75	filled
10 Sept, 12:20	BANKNIFTY 09-15 59700 PE	SELL	30	343.60	filled · auto
10 Sept, 10:35	BANKNIFTY 09-15 59700 PE	BUY	30	436.40	filled
09 Sept, 15:15	BANKNIFTY 09-15 59600 PE	SELL	30	477.20	filled · auto
09 Sept, 14:40	BANKNIFTY 09-15 59600 PE	BUY	30	483.10	filled
09 Sept, 12:00	BANKNIFTY 09-15 59400 CE	SELL	30	445.05	filled · auto
09 Sept, 09:45	BANKNIFTY 09-15 59400 CE	BUY	30	600.85	filled
08 Sept, 14:35	BANKNIFTY 09-29 59000 PE	SELL	30	592.75	filled · auto
08 Sept, 12:35	BANKNIFTY 09-29 59000 PE	BUY	30	745.30	filled

Bottom half: open positions, closed trades and the order history.

Table	What it shows
Open positions	Contract, lots, average price you paid, current mark price, unrealised profit and the exit rules (stop, target, square-off time). **Sell to close** sells the position at the current market price.
Closed trades	Exit time, contract, quantity, entry price to exit price, **why it closed** (manual, stop, target, sq-off or expiry) and net profit after costs. Hover the profit to see gross and costs.
Recent orders	Every buy and sell with its market time, price and status (filled, rejected, or an automatic exit).

How to place and manage a paper trade

1. Under **Market clock**, pick a dataset and press **Start clock**. The clock starts a few days before the end of the data so there is room to move forward.
2. In the **Order ticket**, choose an **expiry**. Only expiries that have prices at the market time are listed.
3. Set **lots**, and the **stop %** and **target %** you want (defaults 20 and 40).

4. Click the **Buy** price of the CE or PE you want. The position appears under **Open positions**, and cash drops by price x quantity.
5. Press **+1 candle**, **+12 candles** or **+1 day** to move the market. If a stop, target, square-off or expiry is hit, the position closes by itself and a yellow banner tells you.
6. Or press **Sell to close** at any time to close by hand.
7. Open **Profit & Loss** to review the result.

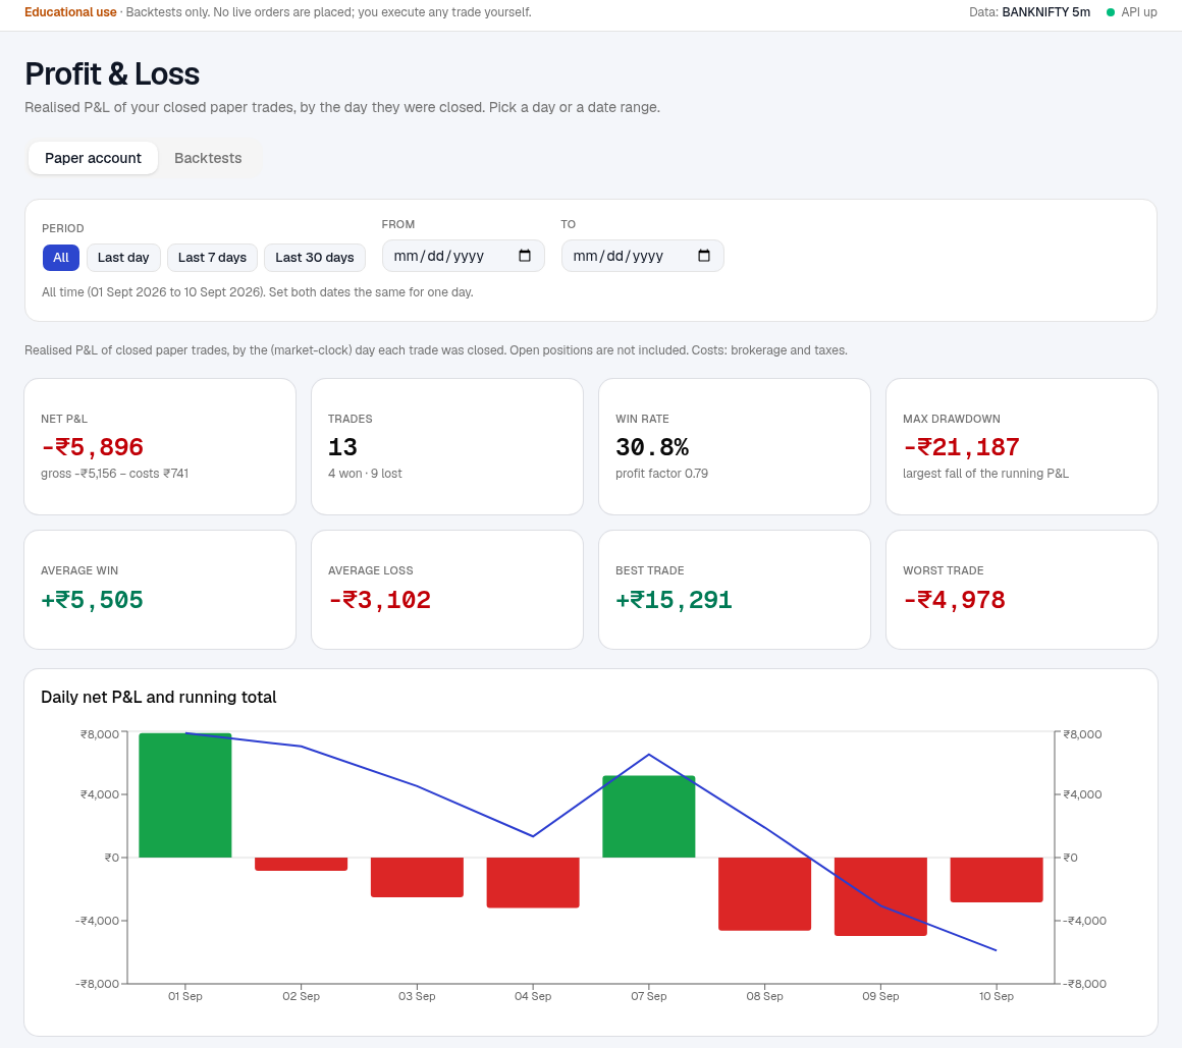

The rules of the simulation

- **Buy only.** You buy options and sell them to close. Selling to open is rejected.
- **Fill price:** the price of the candle the clock is on. Real fills have slippage and delays; these do not.
- **Exit order on each candle:** expiry first, then stop, then target, then square-off time.
- **Costs:** taken when a trade closes: Rs 20 brokerage for each of the two legs plus 0.05% of the turnover. Cash always moves by exactly the trade's net profit.
- **Not enough cash:** the order is rejected and noted in Recent orders.
- **One dataset at a time:** to replay a different dataset or restart the clock, close your positions or reset the account.

> **Careful:** The replayed data may be **fake**. Practise the mechanics (orders, stops, sizing, review), not the strategy's profits.

3.7 Profit & Loss

Use it to: see how much you made or lost on **one day or over a range of dates**.

Profit & Loss: choose a period at the top, read the cards and chart below.

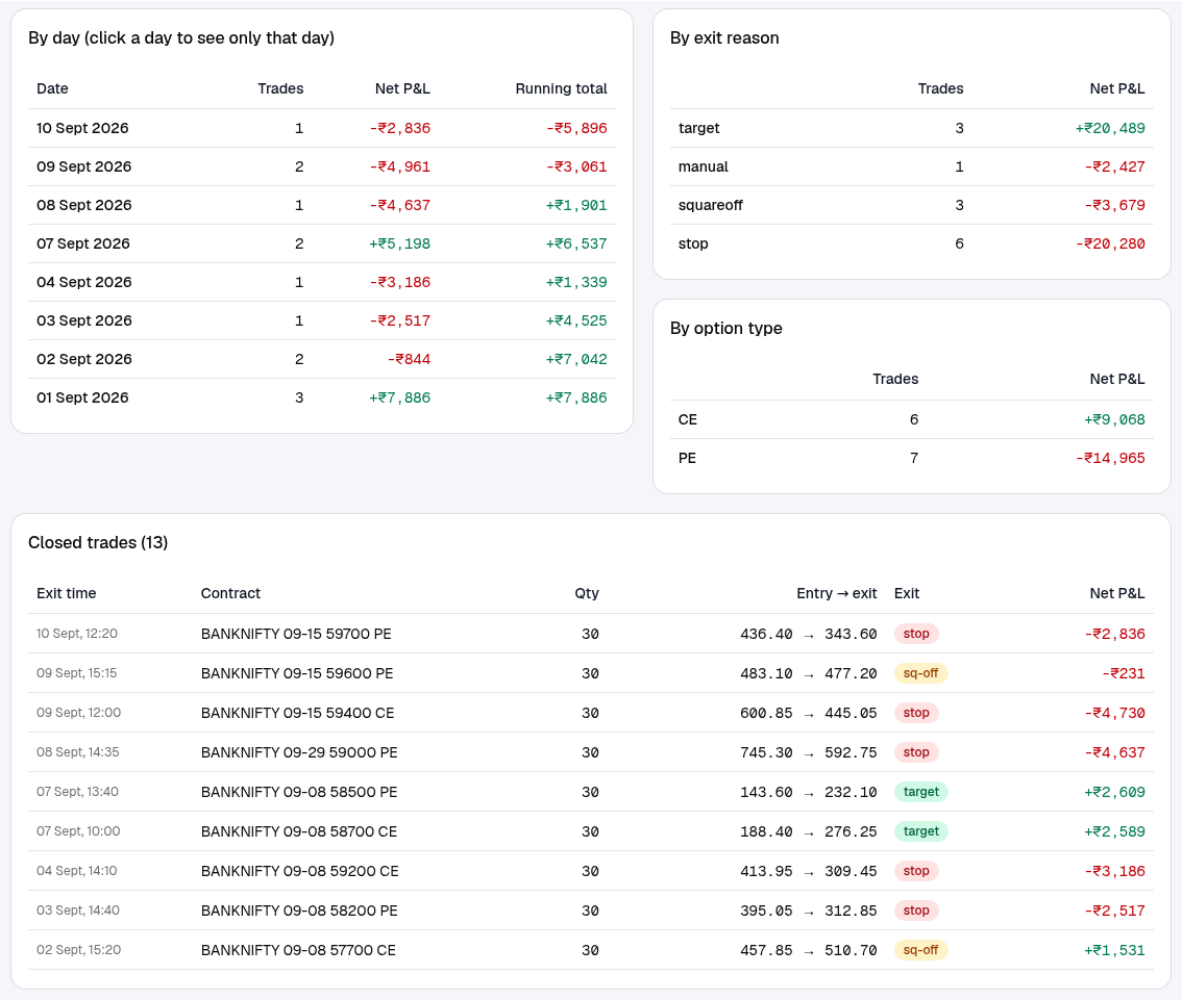

Choosing the dates

Control	How it works
Tabs	**Paper account:** realised P&L of your closed paper trades. **Backtests:** the P&L of your backtests, filtered by the day each was run.
Presets	**All**, **Last day**, **Last 7 days**, **Last 30 days**. They count back from the most recent day that has data.
From and To	Pick any two dates. Set **both to the same date** for a single day.
Click a day	In the **By day** table, click a row to show only that day.

How to see one day, or a range

1. Open **Profit & Loss** and stay on the **Paper account** tab.
2. For one day: type the same date in **From** and **To**, or click that day in the **By day** table.
3. For a range: set **From** and **To**, or press a preset such as **Last 7 days**.

4. To go back to everything, press **All**.

By day (click a day to see only that day)

Date	Trades	Net P&L	Running total
10 Sept 2026	1	-₹2,836	-₹5,896
09 Sept 2026	2	-₹4,961	-₹3,061
08 Sept 2026	1	-₹4,637	+₹1,901
07 Sept 2026	2	+₹5,198	+₹6,537
04 Sept 2026	1	-₹3,186	+₹1,339
03 Sept 2026	1	-₹2,517	+₹4,525
02 Sept 2026	2	-₹844	+₹7,042
01 Sept 2026	3	+₹7,886	+₹7,886

By exit reason

	Trades	Net P&L
target	3	+₹20,489
manual	1	-₹2,427
squareoff	3	-₹3,679
stop	6	-₹20,280

By option type

	Trades	Net P&L
CE	6	+₹9,068
PE	7	-₹14,965

Closed trades (13)

Exit time	Contract	Qty	Entry → exit	Exit	Net P&L
10 Sept, 12:20	BANKNIFTY 09-15 59700 PE	30	436.40 → 343.60	stop	-₹2,836
09 Sept, 15:15	BANKNIFTY 09-15 59600 PE	30	483.10 → 477.20	sq-off	-₹231
09 Sept, 12:00	BANKNIFTY 09-15 59400 CE	30	600.85 → 445.05	stop	-₹4,730
08 Sept, 14:35	BANKNIFTY 09-29 59000 PE	30	745.30 → 592.75	stop	-₹4,637
07 Sept, 13:40	BANKNIFTY 09-08 58500 PE	30	143.60 → 232.10	target	+₹2,609
07 Sept, 10:00	BANKNIFTY 09-08 58700 CE	30	188.40 → 276.25	target	+₹2,589
04 Sept, 14:10	BANKNIFTY 09-08 59200 CE	30	413.95 → 309.45	stop	-₹3,186
03 Sept, 14:40	BANKNIFTY 09-08 58200 PE	30	395.05 → 312.85	stop	-₹2,517
02 Sept, 15:20	BANKNIFTY 09-08 57700 CE	30	457.85 → 510.70	sq-off	+₹1,531

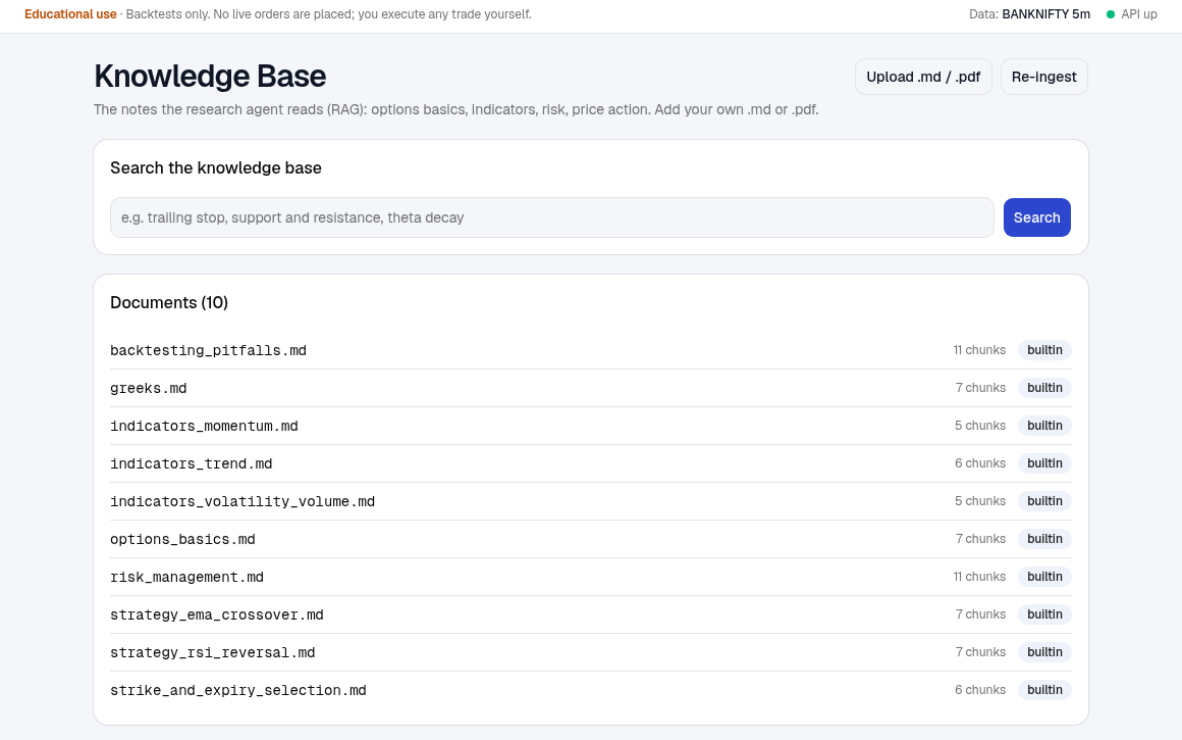

Lower half: the day-by-day table, breakdowns, and the closed trades in the period.

Part	What it tells you
Net P&L card	Profit or loss after costs for the period, with the gross figure and the costs underneath.
Trades, Win rate	How many trades, how many won or lost, and the profit factor.
Max drawdown	The largest fall of your running profit inside the period.
Average win and loss, Best and Worst trade	The size of typical and extreme trades.
Chart	Bars: each day's net profit (green) or loss (red). Blue line: the running total.
By exit reason	Which kinds of exit made or lost money (target, stop, square-off, manual, expiry).
By option type	How your CE trades compared with your PE trades.
Closed trades	Every trade in the period.

> **Note:** Only **closed** trades count. Open positions are shown on Paper Trading. Dates are **market-clock days**, that is the day inside the replayed data when the trade closed, not today's calendar date.

3.8 Knowledge Base

Use it to: see, search and add to the notes the research agent reads. Better notes lead to better-grounded plans.

Search the notes at the top; the list below shows every document and how many pieces it was cut into.

Part	What it does
Search box	Type a topic (for example "trailing stop" or "theta decay") and press **Search**. You see the matching passages, the file and heading they came from, and a relevance score.
Documents list	Each note file with its number of chunks and a badge: **builtin** (shipped with the app) or **uploaded** (yours).
Upload .md / .pdf	Add your own notes as a Markdown or PDF file.
Re-ingest	Re-reads all notes and refreshes the search index. Use it if a document seems missing or out of date.

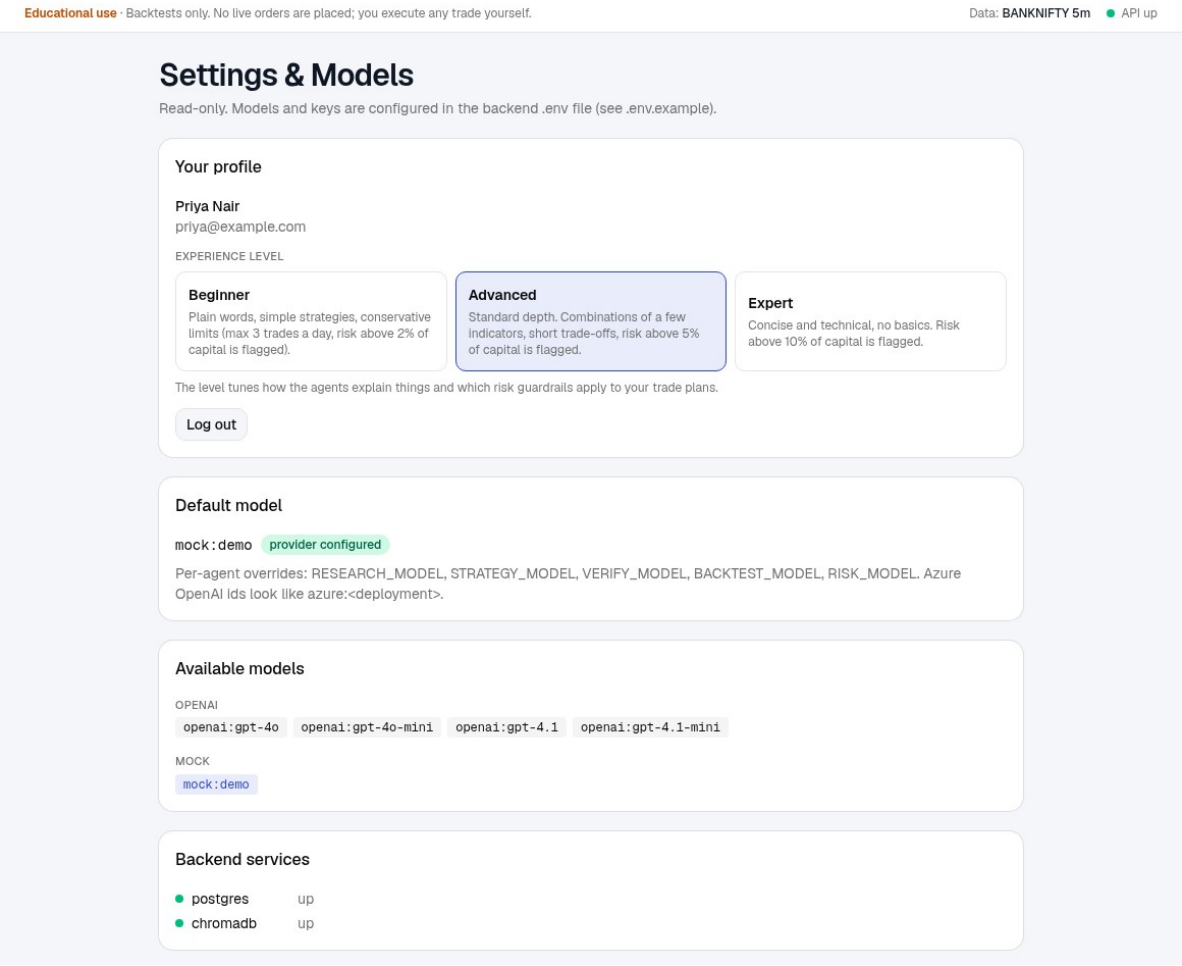

How to add your own notes

1. Prepare a short **.md** or **.pdf** file about one topic, with clear headings.
2. Press **Upload .md / .pdf** and choose the file. A green message confirms how many chunks were added.
3. Search for a phrase from your note to check it is found.
4. Generate a new plan; the research may now cite your file under **Sources**.

> **Tip:** Write notes the way you would explain a rule to a friend: one idea per heading, with an example. Do not paste secrets or personal data.

3.9 Settings & Models

Use it to: change your experience level and see which AI models and services the app is using.

Settings: your profile and level on top, then the models and services.

Part	What it does
Your profile	Your name and email. Click **Beginner**, **Advanced** or **Expert** to change your level straight away. **Log out** is here too.
Default model	The model used when you do not pick one on the Strategy Desk, and whether its provider is set up.
Available models	Every model you can choose, grouped by provider. The default is highlighted.
Backend services	Whether the database and the search store are running.

> **Note:** Models and keys are not changed here; whoever runs the app sets them in its configuration. If no real model is available you can only use the offline demo model.

4. Step-by-step recipes

A. From an idea to a paper trade

1. **Strategy Desk:** write your query with the index, expiry and limits. Pick a real model. Press **Generate strategy**.
2. Read **AI recommendation**. Check the verdict, the lots, the stop and target, and the reasons.
3. Read the **Risk review** box in the pipeline panel. Note any red flags such as few trades or a big drawdown.
4. Press **Open full backtest results** and look at the equity curve, drawdown and trade count.
5. Happy to practise it? Go back and press **Paper trade CE** or **Paper trade PE**.
6. On **Paper Trading**, press **+12 candles** a few times and watch the position.
7. When it closes, open **Profit & Loss** and look at the day.

B. Test a strategy idea you already have

1. **Backtest > New backtest.** Choose the dataset and the closest template (EMA Crossover or RSI Reversal).
2. Set the dates and capital. Press **Run backtest**.
3. Study the cards and charts. Filter the **Trade log** by exit reason to see where it loses.
4. For a custom idea (your own indicators and limits), use the Strategy Desk and name the indicators in your query.

C. Review how you did last week

1. Open **Profit & Loss**, **Paper account** tab.
2. Press **Last 7 days** (or set **From** and **To**).
3. Read the **Net P&L** and **Win rate** cards, then **By exit reason**: if most losses are stops, your stops may be too tight for the option.
4. Click a bad day in **By day** and read its trades.

D. Start over with clean virtual money

1. Open **Paper Trading** and press **Reset account**.
2. Type the starting balance and confirm. Positions, orders and trades are deleted.
3. Press **Start clock** again and choose a dataset.

E. Teach the research agent something new

1. Open **Knowledge Base**.
2. Upload a short **.md** or **.pdf** note.
3. Search for it, then generate a plan on a related topic.

5. How the numbers are worked out

The AI writes the rules and the reasons. **All numbers are worked out by ordinary program code, not by the AI**, so they can be checked.

Lots, stop and target from your rupee limits

The app estimates the option's entry premium from the data (the typical at-the-money price at the first candle of the entry window). Then:

- **Lots** = your max loss divided by (premium x lot size x stop %), rounded **down**.
- **Target %** = your target profit divided by (lots x lot size x premium), as a percentage.
- If even one lot would lose more than your limit, the stop is tightened so that one lot fits, and a note says so.

> **Note:** **Worked example (BANKNIFTY, lot size 30).** Max loss Rs 5,000 per trade, target Rs 12,000. Estimated premium Rs 769.74 and a 10% stop: one lot would lose 30 x 769.74 x 10% = Rs 2,309, so **2 lots** fit (Rs 4,618, under Rs 5,000). For the target: 12,000 / (2 x 30 x 769.74) = 26%. That gives the plan you saw: **2 lots x 30 = 60, stop 10%, target 26%**.

Why the plan can differ from what you typed

- Lots are whole numbers and are rounded down, so the real loss is a little **below** your limit and the real target a little off.
- The premium is an **estimate** from past data; real prices will differ.
- A **Beginner** profile adds a 3-trades-a-day cap and a risk note above 2% of capital.
- If the strategy has no stop, the app uses 20% before sizing.

Paper trading costs

Each closed trade pays 2 x Rs 20 brokerage plus 0.05% of (entry value + exit value). Example: buy 60 units at 400 and sell at 500 = gross Rs 6,000. Costs = 40 + 0.05% x (24,000 + 30,000) = Rs 67. Net = Rs 5,933.

6. Troubleshooting and FAQ

What you see	What it means and what to do
"Please log in again." or you are sent to the login screen	Your login ended (it lasts about a week, or you logged out elsewhere). Log in again.
"Invalid email or password"	Check both. The message is the same for a wrong email and a wrong password on purpose. After eight wrong tries within ten minutes the email is locked for a while.
"Describe your view or trade first."	The query box is empty. Type a request.
"Pick an underlying (NIFTY or BANKNIFTY)..."	Click NIFTY or BANKNIFTY, or mention it in your query.
"No BANKNIFTY dataset with option candles; load one first"	There is no market data for that index. Ask whoever runs the app to load a dataset.
"Provider ... is not configured"	The chosen model's service is not set up. Pick another model in the Model box, or ask for the key to be added.
Model box warns that the default is the offline mock model	Answers will be scripted and shallow. Choose a real model such as an OpenAI model for real reasoning.
Verifier says "needs changes"	The checker still saw issues after two revisions. Read the reasons, rephrase the query with clearer rules, or use the plan cautiously.
A step failed in the pipeline	Open the run from the Dashboard and read the red message under the step. Often running again fixes a temporary model error.
Backtest shows 0 trades or empty charts	The rules never triggered in that period, or the period is too short. Use a longer range or different rules.
"Start the market clock first: choose a dataset to replay"	On Paper Trading, pick a dataset and press **Start clock**.
"Insufficient cash: this order needs Rs ..."	Fewer lots, a cheaper option (further out of the money), or **Reset account** for a fresh balance.
"... is not an available expiry at the market time"	That expiry has no prices yet at the current market time. Pick one from the dropdown or move the market on.
"That contract has no price at the market time"	Pick another strike or move the clock.
"You hold N lot(s); selling to open is not supported"	Paper trading only sells what you already hold. Use **Sell to close** with up to your lots.
"Close your open positions (or reset the account) before ..."	You cannot restart the clock or switch dataset while positions are open. Close them or reset.
"The plan says 'sell PE': selling to open is not supported"	This plan sells options. Paper trading follows only plans that buy.

What you see	What it means and what to do
Expiry in the dropdown says "past"	The plan's expiry date has gone by in real time. It is still valid for replayed data, but for a real trade you would pick a current expiry.
The page shows an error box after an update	Refresh with Ctrl+Shift+R. If it stays, tell whoever runs the app.

FAQ

Is this real money? No. Paper trading uses virtual money, and the app cannot place real orders.

Are the prices live? No. They come from loaded datasets, fake or historical, replayed by a clock.

Why does my balance change when I do not trade? It does not. Your equity changes when the market clock moves and your open positions gain or lose value.

Can I sell an option I do not own? Not yet. Paper trading is buy-and-sell-to-close only.

Can two people share one account? Each person should have their own login. Strategies, backtests, runs and the paper account are private to each user.

How do I change my level? Settings & Models > Your profile > click a level.

7. Limits and safety

- **Educational only.** The app and its plans are research tools, not investment advice, and never promise profit.
- **Data limits.** Backtests and paper trading use the data you have loaded. Fake data has no real market behaviour. Real historical option data may be limited (for example only recent expiries from some providers).
- **Estimates.** Premiums, lots and costs are estimates. Real fills have slippage, delays and different charges.
- **Lot sizes and expiry days change.** Check them with the exchange or your broker before any real trade.
- **One-direction practice.** Only buying options is simulated, so spreads and selling strategies are not practised here.
- **Your account.** Use a strong password. Demo accounts and their shared password exist only for local testing and should be switched off anywhere else.
- **In India,** offering virtual trading to the public is regulated; the regulator has warned about unauthorised virtual-trading apps. Get proper advice before offering this app to others.

Appendix: sources used for the explanations

The wording of the glossary and the structure of this guide drew on the following public pages. They were checked in October 2026; details such as lot sizes and tax rates change, so verify them on the official sites.
